Recap: what does it mean to solve a differential equation?

Recap: what does it mean to solve a differential equation numerically?

Метод Эйлера

$$\frac{y_{i+1} - y_i}{h} = f(x_i, y_i);$$

$$y_{i+1} = y_i + f(x_i, y_i)h;$$

- 1) $y_1 = y_a$ (начальное условие);
- 2) $y_2 = y_1 + f(x_1, y_1)h;$
- 3) $y_3 = y_2 + f(x_2, y_2)h;$
- ...
- n) $y_n = y_{n-1} + f(x_{n-1}, y_{n-1})h.$

Recap: what does it mean to solve a differential equation numerically?

Методы Рунге-Кутта

$$\frac{dy}{dx} = f(x, y), \quad y(0) = y_0, \quad x \in [0; X]$$

Идея: замена искомого решения несколькими членами разложения в ряд Тейлора:

$$y_{i+1} = y(x_i) + \frac{y'(x_i)}{1!}h + \frac{y''(x_i)}{2!}h^2 + \frac{y'''(x_i)}{3!}h^3 + \dots$$

Для нахождения y_{i+1} необходимо вычислить 4 числа:

$$m_1 = f(x_i, y_i);$$

$$m_2 = f\left(x_i + \frac{h}{2}, y_i + \frac{h}{2}m_1\right);$$

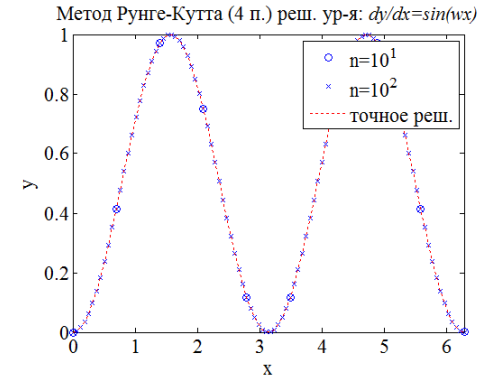

$$m_3 = f\left(x_i + \frac{h}{2}, y_i + \frac{h}{2}m_2\right);$$

$$m_4 = f(x_i + h, y_i + hm_3);$$

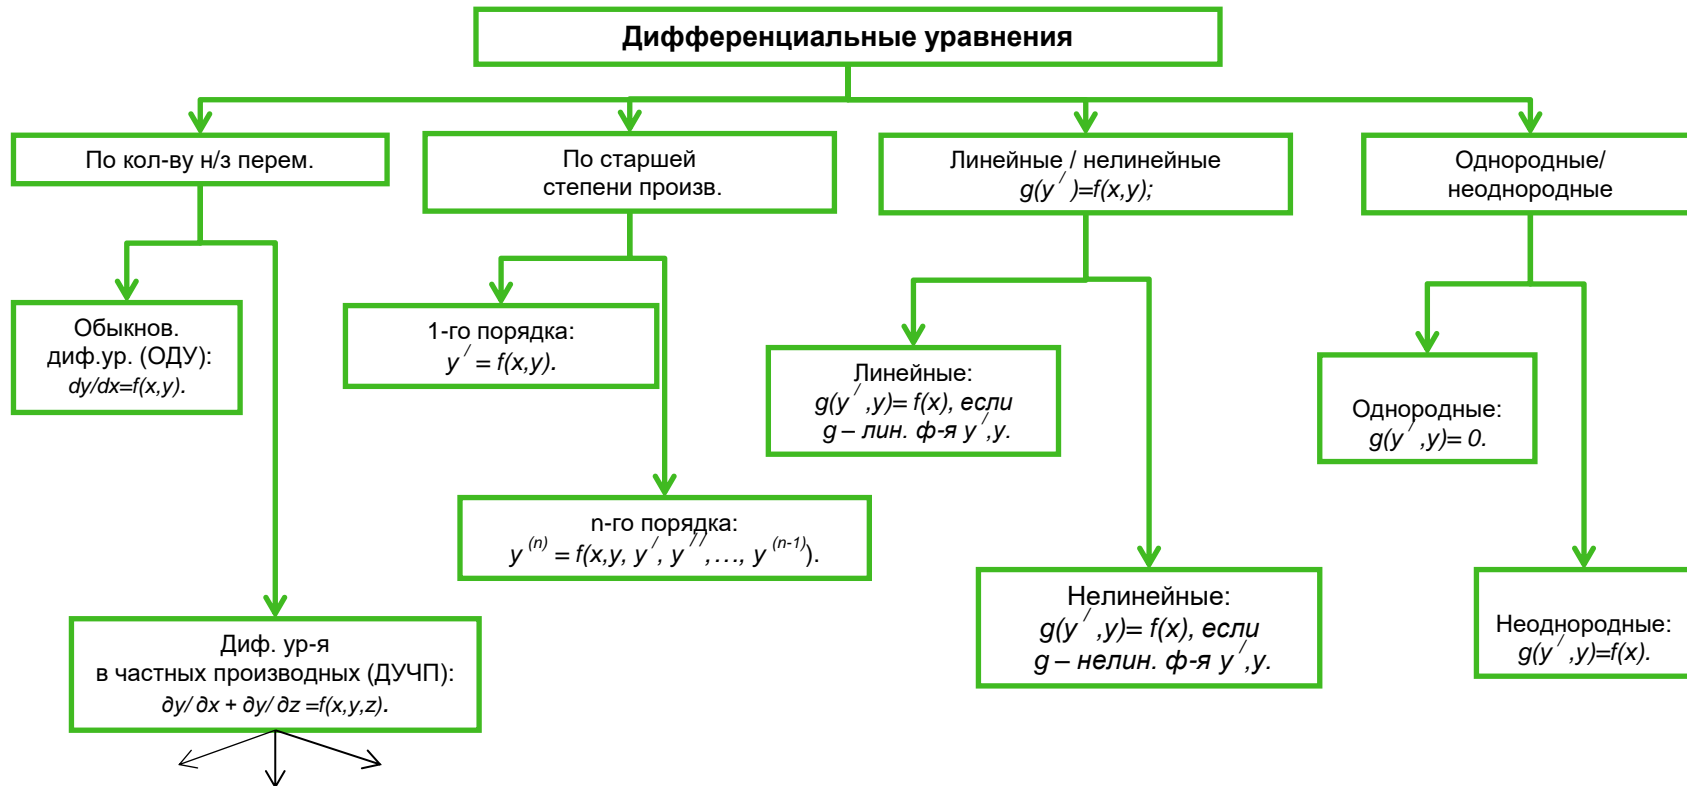

после воспользоваться формулой:

$$y_{i+1} = y_i + \frac{h}{6}(m_1 + 2m_2 + 2m_3 + m_4).$$

Recap: what does it mean to solve a differential equation numerically?

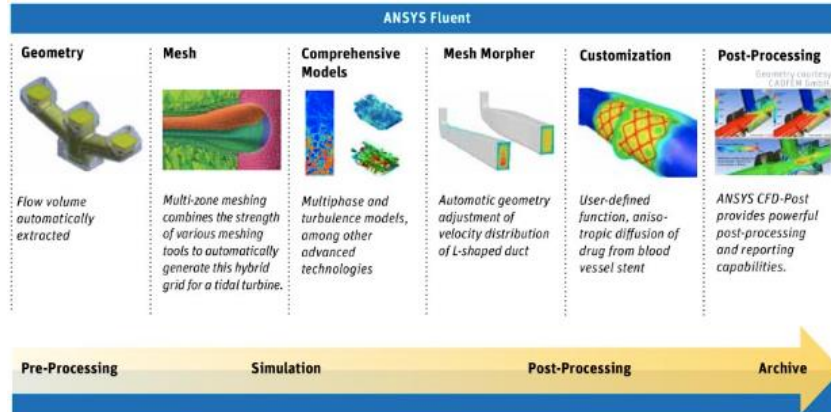

Recap: classification of differential equations

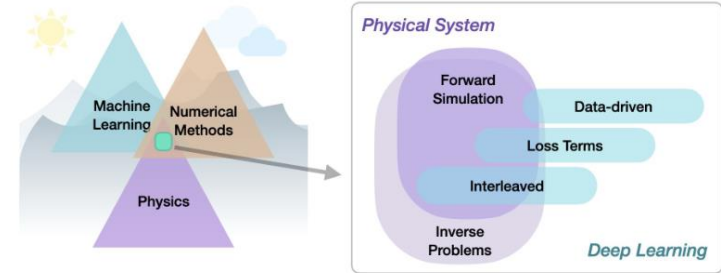

CAE-systems **vs** machine learning

Physics and CAE-systems

Machine learning

- + Prospects:**
almost any problem can be solved;
- Limitations:**
the software is expensive;
it is hard to use and verify the obtained results.

Physics-informed machine learning: supervised training (diff. eqs. participation level: 0 %)

Given m pairs of data: $((x_i, y_i^*))$.

In supervised learning we approximate y^* using function $f = f(x_i, \theta)$ ($i = 1, \dots, m$) by minimizing loss:

$$\arg \min_{\theta} \sum_i (f(x_i, \theta) - y_i^*)^2.$$

Physics-informed machine learning: physical loss terms (DEs participation level: up to 100 %)

Given PDE:

$$\frac{\partial u}{\partial t} = \mathbf{F}\left(\frac{\partial u}{\partial x}, \frac{\partial^2 u}{\partial x^2}, \dots, \frac{\partial^n u}{\partial x^n}\right),$$

with unknown function: $\mathbf{u} = \mathbf{u}(\mathbf{x}, t)$.

Residual \mathbf{R} should be equal to zero: $\mathbf{R} = \frac{\partial u}{\partial t} - \mathbf{F}\left(\frac{\partial u}{\partial x}, \frac{\partial^2 u}{\partial x^2}, \dots, \frac{\partial^n u}{\partial x^n}\right)$.

$$\arg \min_{\theta} \alpha_0 \sum_i (f(x_i; \theta) - y_i)^2 + \alpha_1 R(x_i),$$

Physics-informed machine learning: physical loss (a conservation law: 100 %)

4.2. Deep Energy Method

The main idea of the method advocated in this contribution is to take advantage of the variational (energetic) structure of some BVPs. To that end, the energy of the system is used as the loss function for the DNN, as proposed by [14]. Due to its mechanical flavor, we name it the Deep Energy Method (DEM) here. One of the key ingredients is to approximate the energy of the body by a weighted sum of the energy density at integration points. Then, the following form for the loss function, $\mathcal{L}(p)$ is obtained:

$$\mathcal{E}[u_p] \approx \mathcal{L}(p) = \sum_i \Psi(\epsilon(u_p(x_i))) w_i, \quad (12)$$

```
net_uv(self,x,y,vdelta):  
X = tf.concat([x,y],1)  
uv = self.neural_net(X,self.weights,self.biases)  
uNN = uv[:,0:1]  
vNN = uv[:,1:2]  
u = (1-x)*x*uNN  
v = y*(y-1)*vNN  
return u, v
```

Good news: AI libraries (Pytorch, TF) can calculate derivatives very well

Optional Reading - Vector Calculus using `autograd`

Mathematically, if you have a vector valued function $\vec{y} = f(\vec{x})$, then the gradient of \vec{y} with respect to \vec{x} is a Jacobian matrix J :

$$J = \begin{pmatrix} \frac{\partial y_1}{\partial x_1} & \dots & \frac{\partial y_1}{\partial x_n} \\ \vdots & \ddots & \vdots \\ \frac{\partial y_m}{\partial x_1} & \dots & \frac{\partial y_m}{\partial x_n} \end{pmatrix}$$

Generally speaking, `torch.autograd` is an engine for computing vector-Jacobian product. That is, given any vector \vec{v} , compute the product $J^T \cdot \vec{v}$

If \vec{v} happens to be the gradient of a scalar function $l = g(\vec{y})$:

$$\vec{v} = \begin{pmatrix} \frac{\partial l}{\partial y_1} & \dots & \frac{\partial l}{\partial y_m} \end{pmatrix}^T$$

then by the chain rule, the vector-Jacobian product would be the gradient of l with respect to \vec{x} :

$$J^T \cdot \vec{v} = \begin{pmatrix} \frac{\partial y_1}{\partial x_1} & \dots & \frac{\partial y_m}{\partial x_1} \\ \vdots & \ddots & \vdots \\ \frac{\partial y_1}{\partial x_n} & \dots & \frac{\partial y_m}{\partial x_n} \end{pmatrix} \begin{pmatrix} \frac{\partial l}{\partial y_1} \\ \vdots \\ \frac{\partial l}{\partial y_m} \end{pmatrix} = \begin{pmatrix} \frac{\partial l}{\partial x_1} \\ \vdots \\ \frac{\partial l}{\partial x_n} \end{pmatrix}$$

This characteristic of vector-Jacobian product is what we use in the above example; `external_grad` represents \vec{v} .

ANNs for ODEs solution intuition

We are interested in modelling the displacement of the mass on a spring (green box) over time.

This is a canonical physics problem, where the displacement, $u(t)$, of the oscillator as a function of time can be described by the following differential equation:

$$m \frac{d^2 u}{dt^2} + \mu \frac{du}{dt} + ku = 0,$$

where m is the mass of the oscillator, μ is the coefficient of friction and k is the spring constant.

$$L(\theta) = \frac{1}{N} \sum_i^N (NN(t_i; \theta) - \underline{u_i})^2$$

PINNs for ODEs solution intuition

$$L(\theta) = \frac{1}{N} \sum_i^N (NN(t_i; \theta) - \underline{u_i})^2 + \frac{\lambda}{M} \sum_j^M \left(\left[m \frac{d^2}{dt^2} + \mu \frac{d}{dt} + k \right] NN(\underline{t_j}; \theta) \right)^2$$

From a ML perspective:

- Physics loss is an **unsupervised** regulariser, which adds prior knowledge

From a mathematical perspective:

- PINNs provide a way to solve PDEs:
 - Neural network is a mesh-free, **functional** approximation of PDE solution
 - Physics loss is used to assert solution is **consistent** with PDE
 - Supervised loss is used to assert boundary/initial conditions, to ensure solution is **unique**

PINNs training algorithm

Training loop:

1. Sample boundary/ physics training points
2. Compute network outputs
3. Compute 1st and 2nd order gradient of network output **with respect to network input** \leq **(recursively) apply autodiff, extending graph**
4. Compute loss
5. Compute gradient of loss function **with respect to network parameters** \leq **apply autodiff on extended graph**
6. Take gradient descent step

```

We are interested in modelling the displacement of the mass on a spring (green box) over time.

This is a canonical physics problem, where the displacement, $u(t)$, of the oscillator as a function of time can be described by the following differential equation:

$$m \frac{d^2 u}{dt^2} + \mu \frac{du}{dt} + ku = 0,$$

where m is the mass of the oscillator, μ is the coefficient of friction and k is the spring constant.

We will focus on solving the problem in the **under-damped state**, i.e. where the oscillation is slowly damped by friction (as displayed in the animation above).

Mathematically, this occurs when:

$$\delta < \omega_0, \quad \text{where } \delta = \frac{\mu}{2m}, \quad \omega_0 = \sqrt{\frac{k}{m}}.$$

Furthermore, we consider the following initial conditions of the system:

$$u(t=0) = 1, \quad \frac{du}{dt}(t=0) = 0.$$

For this particular case, the exact solution is known and given by:

$$u(t) = e^{-\delta t} (2A \cos(\phi + \omega t)), \quad \text{with } \omega = \sqrt{\omega_0^2 - \delta^2}.$$

For a more detailed mathematical description of the harmonic oscillator, check out this blog post: https://beltoforion.de/en/harmonic_oscillator/.

Recap: Kinematics → Dynamics ← Statics

Mechanics

studies *motion* of a material point

$$m \frac{dv}{dt} = -bv + mg,$$

declares the *mass conservation law*

$$\frac{dm}{dt} = 0.$$

Mechanics of continua

studies *motion* of the media

$$\rho \frac{dv}{dt} = \nabla \cdot \mathbf{T}_\sigma + \rho \mathbf{f},$$

declares the mass conservation law in the form of the *continuity equation*

$$\frac{\partial \rho}{\partial t} + \nabla \cdot (\rho \mathbf{v}) = 0.$$

Nomenclature:

$\nabla = \left[\frac{\partial}{\partial x_i} \right]$ is the *Hamiltonian*;

$\nabla \cdot \mathbf{y} = \left[\frac{\partial y_i}{\partial x_i} \right], \nabla \cdot \mathbf{T}_y = \left[\frac{\partial y_{ik}}{\partial x_i} \right]$ is the *divergence*;

ρ is the *density*;

$\mathbf{v} = [v_i]$ is the *velocity*;

t is *time*;

$\mathbf{T}_\sigma = [\sigma_{ik}]$ is the *stress tensor*;

\mathbf{f} is the *mass force* (e.g. gravity).

Recap: Kinematics → Dynamics ← Statics

Matter (mass) conservation law:

$$\frac{dL}{dt} = 0.$$

Displacement:

$$\mathbf{u} = \mathbf{E} - \mathbf{L}.$$

Velocity:

$$\mathbf{v} = \frac{d\mathbf{E}}{dt}.$$

Stokes formula:

$$\mathbf{T}_\xi = \frac{1}{2} (\nabla \otimes \mathbf{v} + \mathbf{v} \otimes \nabla).$$

Nomenclature:

\mathbf{L}, \mathbf{E} are Lagrangian and Eulerian coord.;

$\mathbf{T}_\xi = [\xi_{ik}]$ is the strain rate tensor;

$\mathbf{T}_a = \mathbf{D}_a + \mathbf{S}_a$ is the decomposition of the tensor into its deviator and spherical part $\mathbf{S}_a = a_0 \mathbf{T}_\delta$, $a_0 = a_{ii}/3$;

$\nabla y = \left[\frac{\partial y}{\partial x_i} \right]$ is the gradient of a scalar func.

$\nabla \otimes \mathbf{y} = \left[\frac{\partial y_k}{\partial x_i} \right]$ is the gradient of a vector func.

Recap: Kinematics → Dynamics ← Statics

The domain Ω with surface S which is characterized by a unit outer normal vector n is under study.

Full stress:

$$\sigma^n = \frac{dF}{dS}.$$

Cauchy formula:

$$\sigma^n = n \cdot T_\sigma.$$

Nomenclature:

P is the total outer force;

$T_\sigma = [\sigma_{ik}]$ is the stress tensor;

$T_a = D_a + S_a$ is the decomposition of the tensor into its deviator and spherical part $S_a = a_0 T_\delta$, $a_0 = a_{ii}/3$.

Recap: Kinematics → Dynamics ← Statics

Mechanics

studies *motion* of a material point

Mechanics of continua

studies *motion* of the media

Taking the Newton hypothesis into account $\mathbf{D}_\sigma = 2\mu\mathbf{D}_\xi$,
and the tensor decomposition rule, supposing that the fluid is incompressible $\rho = \text{const}$,
the motion law transforms into the almost kinematic form – the Navier-Stokes equation

$$\rho \frac{d\mathbf{v}}{dt} = \nabla \cdot \mathbf{T}_\sigma + \rho \mathbf{f}, \quad \longrightarrow \quad \rho \frac{d\mathbf{v}}{dt} = \nabla \sigma_0 + \nabla \cdot (\mu(\nabla \otimes \mathbf{v} + \mathbf{v} \otimes \nabla)) + \rho \mathbf{f},$$

declares the *mass conservation law*

$$m = \text{const.}$$

declares the mass conservation law in
the form of the *continuity equation*

$$\frac{\partial \rho}{\partial t} + \nabla \cdot (\rho \mathbf{v}) = 0. \quad \longrightarrow \quad \nabla \cdot \mathbf{v} = 0.$$

PINNs for PDEs solution intuition

Given a PDE and its boundary/initial conditions

$$\begin{aligned}\mathcal{D}[u(x)] &= f(x), & x \in \Omega \subset \mathbb{R}^d \\ \mathcal{B}_k[u(x)] &= g_k(x), & x \in \Gamma_k \subset \partial\Omega\end{aligned}$$

Where \mathcal{D} is some differential operator, \mathcal{B}_k are a set of boundary operators, and $u(x)$ is the solution to the PDE

PINNs train a neural network to **approximate** the solution to the PDE $NN(x; \theta) \approx u(x)$ using the following loss function:

$$L(\theta) = L_b(\theta) + L_p(\theta)$$

$$L_b(\theta) = \sum_k \frac{\lambda_k}{N_{bk}} \sum_j^{N_{bk}} \|\mathcal{B}_k[NN(x_{kj}; \theta)] - g_k(x_{kj})\|^2 \quad \textbf{Boundary loss}$$

$$L_p(\theta) = \frac{1}{N_p} \sum_i^{N_p} \|\mathcal{D}[NN(x_i; \theta)] - f(x_i)\|^2 \quad \textbf{Physics loss}$$

PINNs for PDEs solution intuition

Given a PDE and its boundary/initial conditions

$$\begin{aligned}\mathcal{D}[u(x)] &= f(x), & x \in \Omega \subset \mathbb{R}^d \\ \mathcal{B}_k[u(x)] &= g_k(x), & x \in \Gamma_k \subset \partial\Omega\end{aligned}$$

Where \mathcal{D} is some differential operator, \mathcal{B}_k are a set of boundary operators, and $u(x)$ is the solution to the PDE

PINNs train a neural network to **approximate** the solution to the PDE $NN(x; \theta) \approx u(x)$ using the following loss function:

$$L(\theta) = L_b(\theta) + L_p(\theta)$$

$$L_b(\theta) = \sum_k \frac{\lambda_k}{N_{bk}} \sum_j \|\mathcal{B}_k[NN(x_{kj}; \theta)] - g_k(x_{kj})\|^2 \quad \text{Boundary loss}$$

$$L_p(\theta) = \frac{1}{N_p} \sum_i \|\mathcal{D}[NN(x_i; \theta)] - f(x_i)\|^2 \quad \text{Physics loss}$$

For example, the 1+1D viscous Burgers' equation:

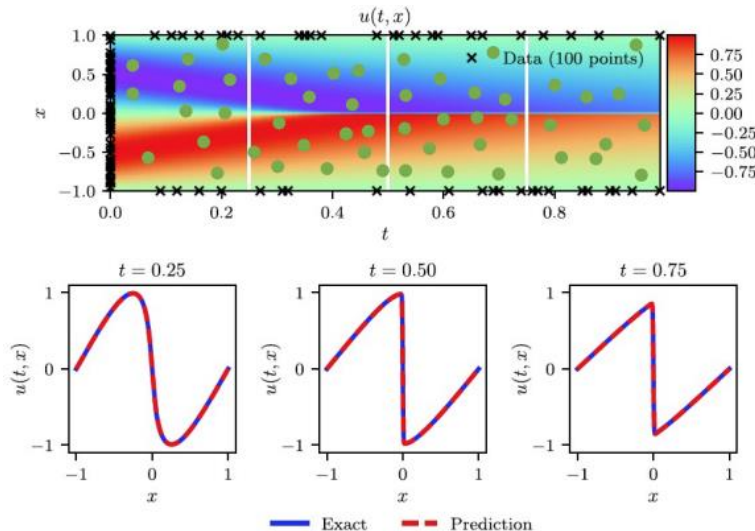

$$\frac{\partial u}{\partial t} + u \frac{\partial u}{\partial x} - \nu \frac{\partial^2 u}{\partial x^2} = 0$$

$$\begin{aligned}u(x, 0) &= -\sin(\pi x) \\ u(-1, t) &= u(+1, t) = 0\end{aligned}$$

$$NN(x, t; \theta) \approx u(x, t)$$

$$\begin{aligned}L_b(\theta) &= \frac{\lambda_1}{N_{b1}} \sum_j^{N_{b1}} (NN(x_j, 0; \theta) + \sin(\pi x_j))^2 \\ &\quad + \frac{\lambda_2}{N_{b2}} \sum_k^{N_{b2}} (NN(-1, t_k; \theta) - 0)^2 \\ &\quad + \frac{\lambda_3}{N_{b3}} \sum_l^{N_{b3}} (NN(+1, t_l; \theta) - 0)^2 \\ L_p(\theta) &= \frac{1}{N_p} \sum_i^{N_p} \left(\left(\frac{\partial NN}{\partial t} + NN \frac{\partial NN}{\partial x} - \nu \frac{\partial^2 NN}{\partial x^2} \right) (x_i, t_i; \theta) \right)^2\end{aligned}$$

PINNs for PDEs solution intuition

Raissi et al, Physics-informed neural networks: A deep learning framework for solving forward and inverse problems involving nonlinear partial differential equations, JCP (2018)

$$L_b(\theta) = \frac{\lambda_1}{N_{b1}} \sum_j^{N_{b1}} (NN(\underline{x}_j, 0; \theta) + \underline{\sin(\pi x_j)})^2$$

$$+ \frac{\lambda_2}{N_{b2}} \sum_k^{N_{b2}} (NN(-1, \underline{t}_k; \theta) - \underline{0})^2$$

$$+ \frac{\lambda_3}{N_{b3}} \sum_l^{N_{b3}} (NN(+1, \underline{t}_l; \theta) - \underline{0})^2$$

$$L_p(\theta) = \frac{1}{N_p} \sum_i^{N_p} \left(\left(\frac{\partial NN}{\partial t} + NN \frac{\partial NN}{\partial x} - v \frac{\partial^2 NN}{\partial x^2} \right) (\underline{x}_i, \underline{t}_i; \theta) \right)^2$$

$v = 0.01/\pi$

$N_p = 10,000$ (Latin hypercube sampling)

$N_{b1} + N_{b2} + N_{b3} = 100$

Fully connected network with 9 layers, 20 hidden units (3021 free parameters)

Tanh activation function

L-BFGS optimiser

PINNs for equation discovery in a hands **on** session: [link](#)

How do we learn an **entire** differential operator \mathcal{D} ?

Build a **library** of n operators, such as:

$$\phi = (1, \partial_x, \partial_t, \partial_{xx}, \partial_{tt}, \partial_{xt})^T$$

Then assume the differential operator can be represented as

$$\mathcal{D} = \Lambda \phi$$

Where Λ is a (sparse) matrix of shape (d_u, n)

E.g. for 1D damped harmonic oscillator:

$$\begin{aligned} \mathcal{D} &= (k \quad \mu \quad m \quad 0) \begin{pmatrix} 1 \\ d_t \\ d_{tt} \\ d_{ttt} \end{pmatrix} \\ &= m \frac{d^2}{dt^2} + \mu \frac{d}{dt} + k \end{aligned}$$

PINNs for equation discovery in a hands on session: [link](#)

How do we learn an **entire** differential operator \mathcal{D} ?

Build a **library** of n operators, such as:

$$\phi = (1, \partial_x, \partial_t, \partial_{xx}, \partial_{tt}, \partial_{xt})^T$$

Then assume the differential operator can be represented as

$$\mathcal{D} = \Lambda \phi$$

Where Λ is a (sparse) matrix of shape (d_u, n)

E.g. for 1D damped harmonic oscillator:

$$\begin{aligned} \mathcal{D} &= \begin{pmatrix} k & \mu & m & 0 \end{pmatrix} \begin{pmatrix} 1 \\ d_t \\ d_{tt} \\ d_{ttt} \end{pmatrix} \\ &= m \frac{d^2}{dt^2} + \mu \frac{d}{dt} + k \end{aligned}$$

PINNs for **equation discovery**:

$$L(\theta, \Lambda) = L_p(\theta, \Lambda) + L_d(\theta)$$

$$\begin{aligned} L_p(\theta, \Lambda) &= \frac{1}{N_p} \sum_i^{N_p} \|\Lambda \phi[NN(x_i; \theta)]\|^2 + \|\Lambda\|^2 && \text{Physics loss} \\ L_d(\theta) &= \frac{\lambda}{N_d} \sum_l^{N_d} \|NN(x_l; \theta) - u_l\|^2 && \text{Data loss} \end{aligned}$$

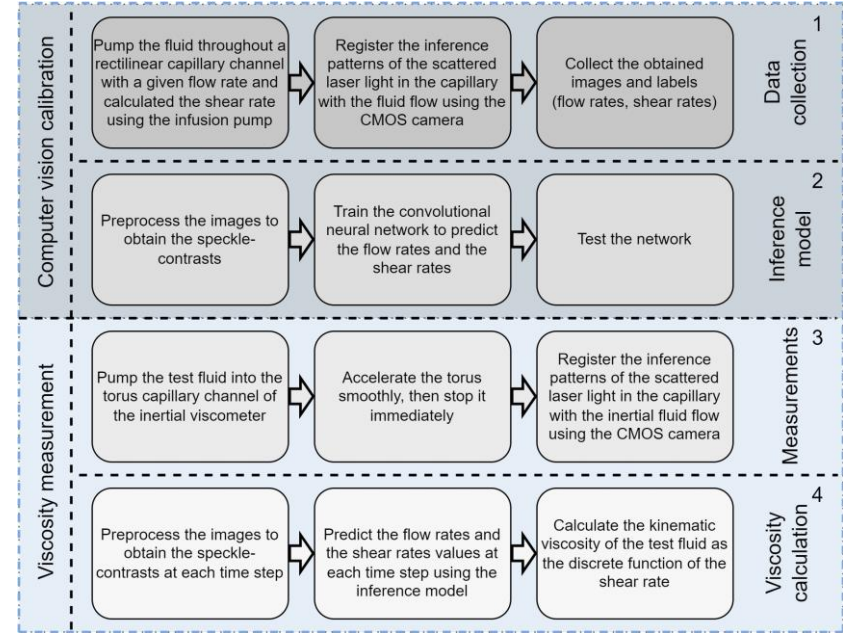

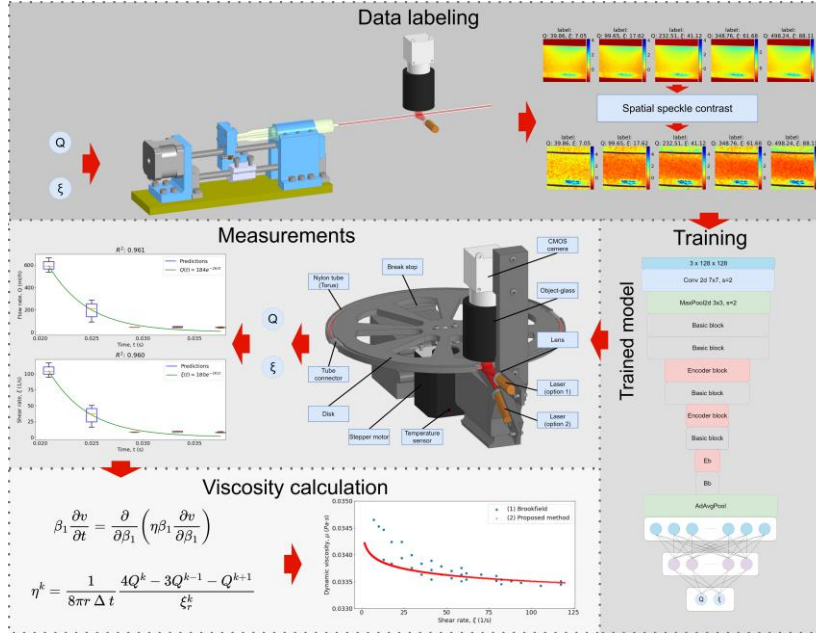

Where Λ are treated as **learnable** parameters and $\{x_l, u_l\}$ are a set of (potentially noisy) observational data

Typically, some regularization / prior on Λ (e.g. sparsity) is needed, as this optimisation problem can be very **ill-posed**

PINNs for equation discovery: viscosity measurement

Viscosity measurement method using inertial viscometer with a computer vision system

ξ^k , Q^k are the share rate on the fluid flow and the flow rate at each time t^k , respectively are obtained by test rig with CV system

PINNs with energy (power) loss

Save energy (power)

$$I[?] = \int f(?, \dots) \rightarrow \min.$$

Save time

(brachistochrone task)

$$T = I[y(x)] = \int_a^b f\left(x, y(x), \frac{dy(x)}{dx}\right) \rightarrow \min.$$

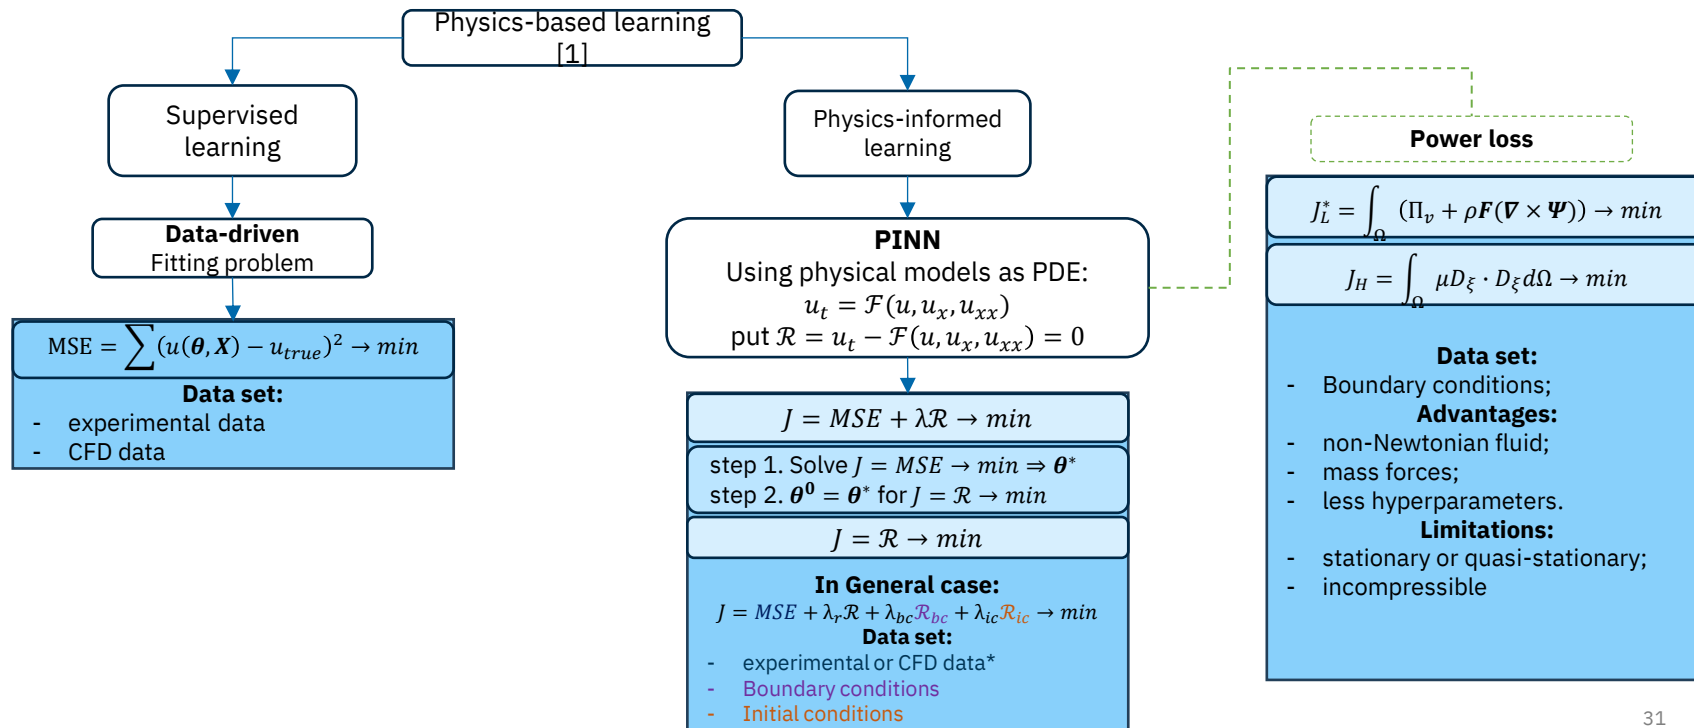

Save lives (Dido task)

$$S = I[y(x)] \rightarrow \max, L = \text{const.}$$

PINNs with energy (power) loss

ML for physical problems as Physics-based learning

PINNs with energy (power) loss Step 1: prove that the loss is true

Variational problem

$$J[v_1(x_i), v_2(x_i)] = \int_{\Omega} f(x_i, v_1, v_2, r_i^k, q_{ij}^k) d\Omega \rightarrow \min(\max),$$

where $r_i^k = v_{k x_i}'$, $q_{ij}^k = v_{k x_i x_j}''$

The generalized Euler's equations have the following form:

$$f_{v_k}' - \frac{\partial}{\partial x_i} (r_i^k) + \frac{\partial^2}{\partial x_i \partial x_j} (q_{ij}^k) = 0, \quad i = 1, 2; k = 1, 2^*$$

Boundary conditions for these second order equations:

$$\begin{aligned} v_k(x_i^0) &= v_i^0 & v_k'(x_i^0) &= u_i^0 \\ v_k(x_i^1) &= v_i^1 & v_k'(x_i^1) &= u_i^1, \end{aligned} \quad i = 1, 2; k = 1, 2$$

1d interpretation

Non-trivial problem: to propose variational problem is equivalent to the partial differential equations (PDEs)

Task in another way: To find such functions $v_1(x_i), v_2(x_i)$ that provide an extremum to the functionality $J[v_1(x_i), v_2(x_i)]$ looks like a **ML task**:

* The Einstein summation notation is used hereinafter

PINNs with energy (power) loss Step 2: minimize the loss

Newtonian 2d fluid flow. Convolutional network and image-based flow domain

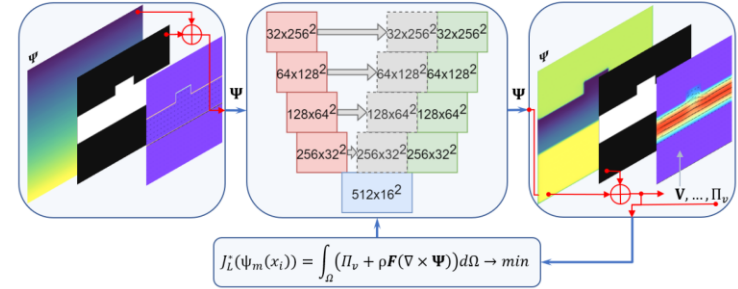

$$\mathbf{V} = \begin{bmatrix} v_1 & v_2 & 0 \end{bmatrix}, \Psi = \psi(x_1, x_2),$$

$$v_1 = \frac{\partial \psi}{\partial x_2}, v_2 = -\frac{\partial \psi}{\partial x_1}, (\nabla \cdot \mathbf{V} = 0)$$

The unknown Ψ function can be represented as a three-dimensional image:

- the position of a pixel in the image corresponds to coordinates;
- the pixel intensity corresponds to the value of the ψ function in the point.
